

Program Administration System

For Efficient Operational Management of Your Online Programs

Our Program Administration System supports the operation of large-scale online education programs with an advanced suite of fully integrated and flexible tools to manage program terms, courses and users. The efficiency of our Program Administration System allows Education Partners to grow their programs without growing their administrative costs. Whether the institution's goal is to expand course and degree offerings or increase enrollments, the Program Administration System provides institutions with the tools and support needed to streamline all aspects of managing online programs.

API for SIS

Almost all Education Partner online program implementations involve integration and interoperability with a Student Information System (SIS). Our Program Administration System's API for SIS provides an efficient method for transferring course, user and enrollment information between the Pearson LearningStudio system and your SIS system.

Based on the industry-leading IMS specification, the API for SIS supports near real-time communication of user creation and enrollment changes from your SIS. This synchronous API integration option automatically updates user and enrollment information in your online campus as soon as a change is made in your SIS.

Additionally, during times of high activity, such as the rollout of your online campus or the beginning of a term, the API for SIS asynchronous option allows you to set up multiple course sections and create and enroll tens of thousands of students in a single operation.

Managing Efficiency and Scalability with Administrative Features and Functions

Synchronized with, and in addition to, the API for SIS, the Program Administration System also gives Education Partners one centralized location to conduct a variety of important administrative tasks. Specifically, you can use the Program Administration System tools to:

- Add new users
- Enroll and manage users in courses
- Update enrollments
- Set up a wide array and highly flexible set of rules and rights for any user in the system
- Create and manage new terms and courses
- Duplicate courses and content for multiple offerings across terms
- Value-added client services for day-to-day operations

Finally, the service side of the Program Administration System comes from Pearson eCollege's Client Services Department, where our Education Partners are provided with full day-to-day operational support services by a professional Client Services Consultant who helps users maintain the proper and effective utilization of the system.
